Platform Engineer

Would you like to help Whiteaway Group's engineers spend less time working around tools and infrastructure, and more time building software?

We're modernizing the platform behind software development at Whiteaway Group. We're moving away from legacy systems, expanding our cloud platform and automating more of the work that slows teams down. We're looking for a Platform Engineer to join our Platform Squad in Aarhus and help make it easier for our engineers to build, deploy and run software.

We treat our platform as a product, and our engineers are the people who use it every day. You'll work directly with development teams to understand where they lose time, decide what to improve and see whether the changes make their work easier.

What you'll help us achieve

Make it easier for teams to deploy and run their software. You'll improve CI/CD pipelines and build self-service tools so teams can handle more routine tasks themselves. You'll work with developers to find the steps that cause delays or require manual work, then help simplify or automate them.

Help us move away from legacy infrastructure while keeping the platform reliable. You'll build and operate infrastructure on AWS and Kubernetes, using Terraform to make changes repeatable. You'll also improve monitoring and observability so teams can spot and diagnose problems, and help make secure access easier to manage.

Shape how we improve the developer experience. You'll help the squad decide which platform improvements will make the biggest difference to development teams. We're also exploring where AI could help the platform squad and the teams we support, and you'll have room to test ideas where they solve a real problem.

What you'll bring

You might be a Platform Engineer, DevOps Engineer, Cloud Engineer or Site Reliability Engineer. You might also be a software engineer who has spent a significant part of your time building or operating cloud infrastructure.

We're interested in what you've improved and how you went about it. Perhaps you've automated a deployment that used to require several manual steps, made a production issue easier to diagnose, or built a tool that helped other engineers work more independently.

We're looking for hands-on experience in several areas of our stack: AWS, Kubernetes and Docker, Terraform, Linux and networking, and Git, GitHub and CI/CD. Experience with Node.js or Go is also relevant. If you've worked with GitOps, Argo CD, Datadog, Spacelift, Cloudflare or cloud security, that's a plus.

Your team and how we work

You'll join four Platform Engineers in a Tech organisation of around 45 people. Whiteaway Group is one of Scandinavia's largest e-commerce companies for home appliances, with more than 300 employees. As we continue investing in the platform, you'll have a say in what the squad builds and how we support development teams across the business.

We make time for learning and sharing knowledge through pair programming, hackathons and Improvement Mondays. You'll also have access to learning resources and personal development opportunities.

We work primarily from our Aarhus office and offer one fixed day per week to work from home. We also offer a pension scheme, a lunch scheme, an on-site gym and free parking.

Interested?

Send us your application and CV via our careers site. We’d love to hear about a platform, tool or workflow you’ve improved: what problem you tackled, what you changed and what difference it made.
We review applications and hold interviews on a rolling basis, and we’ll hire as soon as we find the right person.
